JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

PREVALENCE OF DISEASE.

No health department, State or local, can effectively prevent or control disease without knowledge of when, where, and under what conditions cases are occurring.

IN CERTAIN STATES AND CITIES.

California—Squirrels Collected and Examined.

During the week ended October 25, 1913, 89 ground squirrels from Alameda County were examined for plague infection. No plague-infected squirrel was found.

Washington—Seattle—Plague-Infected Rat.

A case of plague in a rat was verified at Seattle November 14, 1913. The rat was found November 5, 1913.

PLAGUE—Continued.**California—Destruction of Squirrels in 1913.**

In 1912, from March to October, 29,544 squirrels were shot on infected territory; 902, or 3.05 per cent, were found to be infected with plague. From March to October, 1913, 18,722 were shot on infected territory; 417, or 2.17 per cent, were plague infected. There was, therefore, a diminution in the total number of infected squirrels collected in 1913, as compared with the total number in 1912, of 485 squirrels, or 53.7 per cent. The diminution in the number of squirrels shot on infected areas in 1913, as compared with 1912, was 10,822, or 36.6 per cent, although squirrel hunting in 1913 was carried on in a much more detailed and intensive manner than in 1912. More men were engaged in hunting operations and a much larger territory was covered.
